Watson Translator

Made by: Alexandra Schweins, Nakul Mahale, Ahmed Albawabiji

Main Idea:

- The necessity for a powerful translator for complex languages(e.g. Arabic)
- The translator's Users are mostly learners, so they can learn with it.
- Expand the translation's limited languages through an intermediate translation step.
- Feedback for the grammatical errors of the input.

Possible improvement until deadline:

- Mark the incorrect parts of the input with different colors.
- Clickable suggestions.
- Prepositional checker tool.

More Ideas & improvements as big project:

- Improve the prepositional checker.
- Correct the input according to probability.
- examples or corpus.on off.
- Maybe two fields .. One word . Or sentences.
- Integrate Text to Speech (Watson)
- Another adds-on for learn purposes. Like corpus examples or grammatical notes and details like verb forms (just as an optional button)
- Connect the service with google to get probable pictures for input or output.

Backend

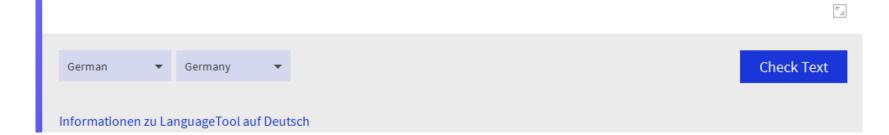

- Watson translator service.
- Grammatical language tool.
 - Comments
 - suggestions
- Flask as a connector to JavaScript
 - Translation
 - Grammatical language tool output

Language Grammatical tool

LanguageTool is a **proofreading service** for English, \rightarrow German, \rightarrow Polish, \rightarrow Russian, and more than \rightarrow 20 other languages.

Fügen Sie hier Ihren Text ein. Klicken Sie nach der Prüfung auf die farbig unterlegten Textstellen. oder nutzen Sie diesen Text als Beispiel für ein Paar Fehler, die LanguageTool erkennen kann: Ihm wurde Angst und bange. Mögliche stilistische Probleme werden blau hervorgehoben: Das ist besser wie vor drei Jahren. Eine Rechtschreibprüfun findet findet übrigens auch statt. Donnerstag, den 27.06.2017 wurde LanguageTool 3.8 veröffentlicht.

Front end :

Previously tried platform: failure with Kinetise, Asp.net with C# and Phonegap with android

Kinetise: It's an third party App which isn't providing sufficient things for student account For example: 1. Source code cannot be read or edited 2. CMS need credits from account

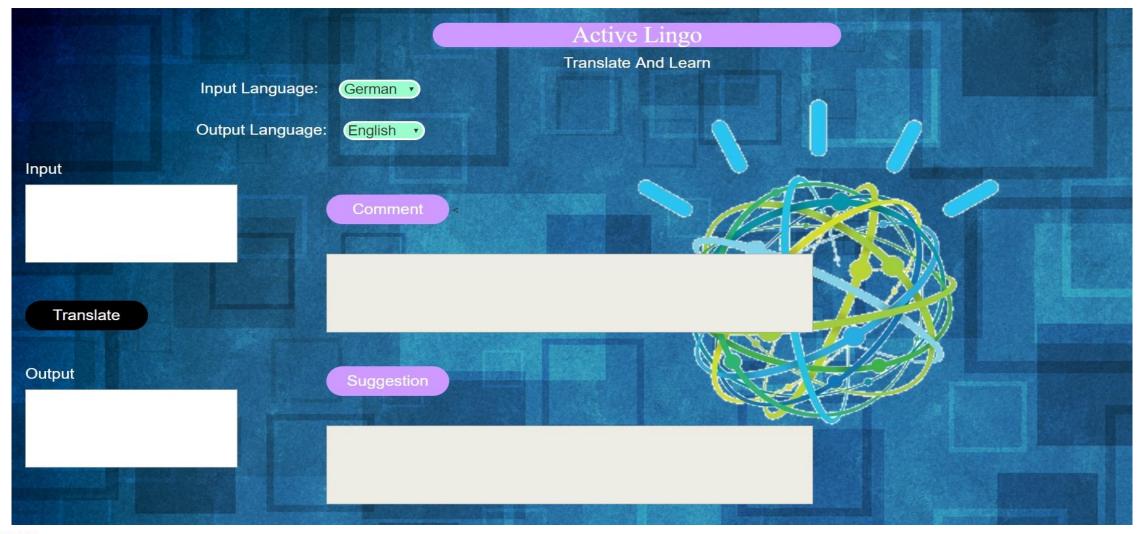

Asp.net with c# : Asp.net provides itself very nice tool box to make an excellent frontend and fast working backend with c# but there wasn't code for c# with which I can use flask on IBM watson service. Code was provided for python (Backend) not for C# by IBM watson Service.It seems like flask and c# are incompatible with each other.

Phonegap with Android: Working on android platform for our team is completely new and none of us know android programming.

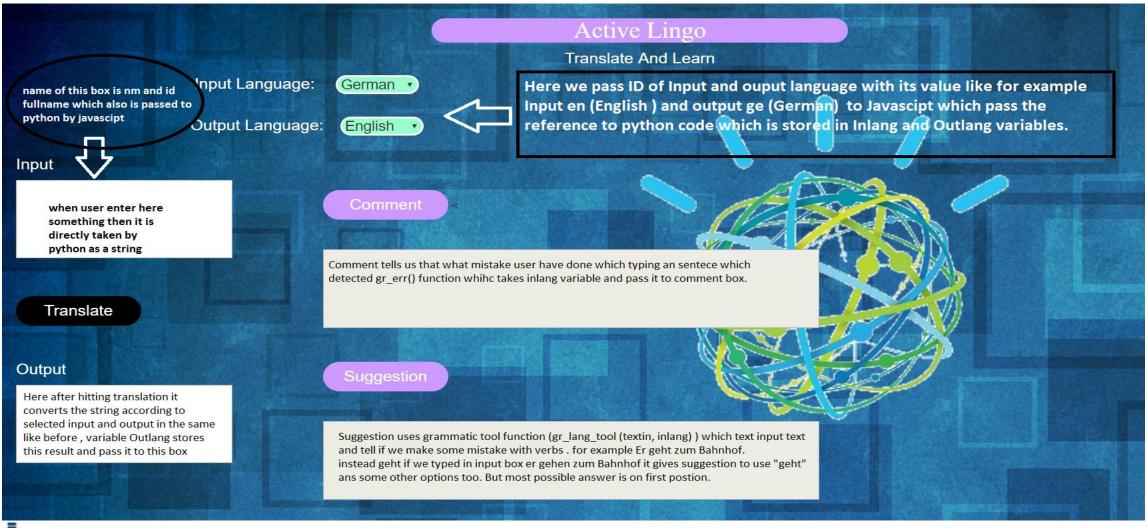

So we moved to classic method ,which is with HTML ,CSS and Javascipt which binds very nicely everything with Python .

First Look of Active Lingo Translator App:

Front end

FRIEDRICH-ALEXANDER UNIVERSITÄT ERLANGEN-NÜRHBERG

Connecting the back end with front end

We used Flask as the most popular Python web development framework:

- translate()-function in .py triggers URL: form data (input text, selected languages) are transmitted in a POST request
- At the end, JSON response is sent to browser

JQuery for exchanging JSON between server and client

- -> separate JQuery script file:
- Function runs when click event occurs: sends input data to the server with an HTTP POST request and inserts translation and grammar data
- access by HTTP anchors (#)

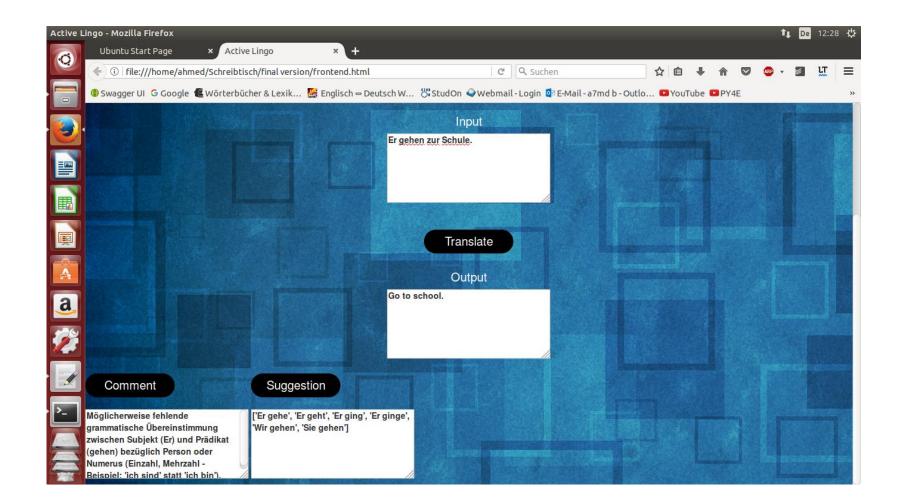

Financial compare

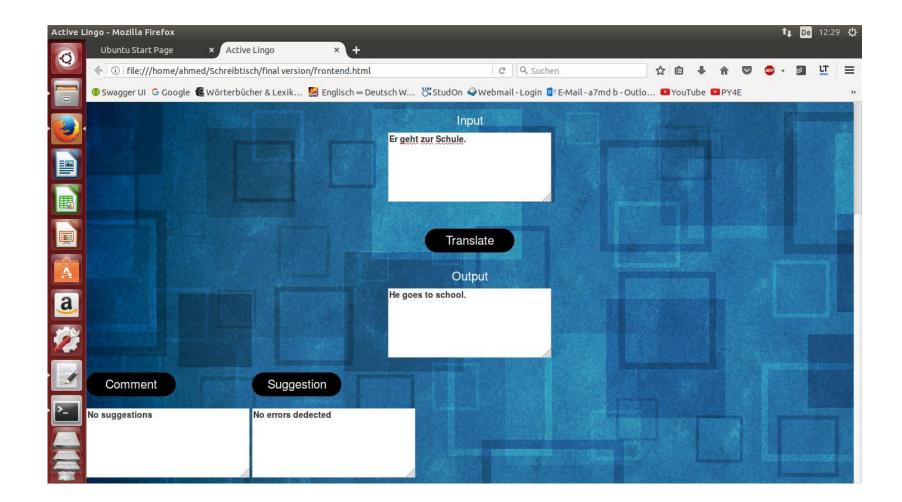

- Quality of Google Translator for example.
- Absence of a powerful grammatical user and translator at the same time.

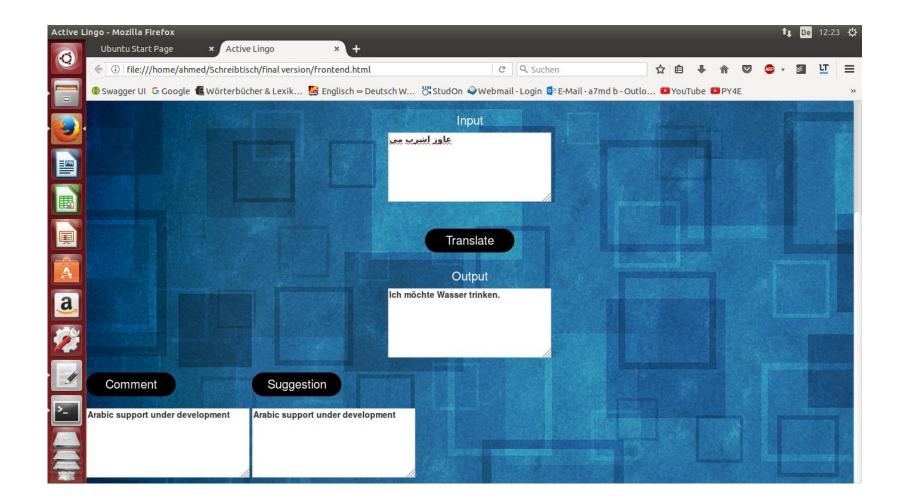

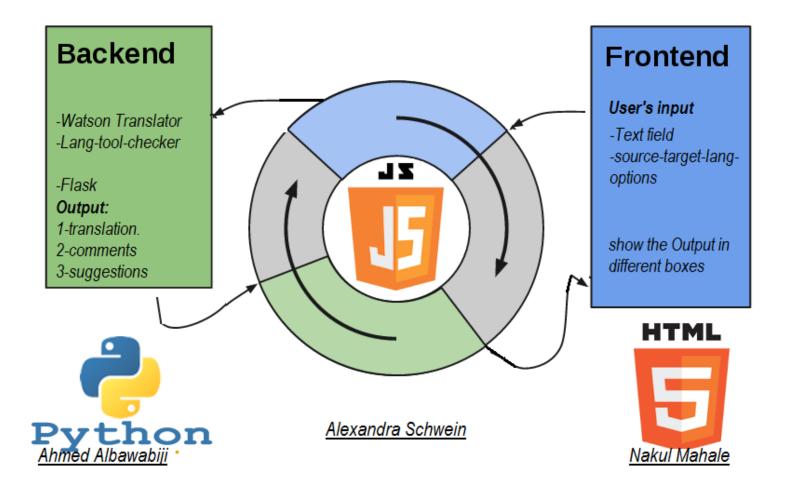

Advantages and disadvantages:

- Not all grammatical errors are covered.
- Lower accuracy for some languages after the intermediate step but still quite better than other translators.
- Advantages:
- Better translation.
- Translating and extensive language checker at the same time.

Work flow
