

Pattern Recognition – Exercises

Introduction to the Classification Toolbox

Peter Fischer, Shiyang Hu

ERLANGEN-NÜRNBERG

TECHNISCHE FAKULTÄT

Exercises

- Theoretical and practical assignments
- No need to hand-in your results
- Requirements
 - Mathematical background: statistics, calculus, linear algebra
 - Useful reference for linear algebra: The Matrix Cookbook
 - MATLAB programming
- Programming tasks: Extending the functionality of the **classification toolbox**
 - Preprocessing algorithms
 - Data sampling
 - Classification algorithms

Classification Toolbox

- Set of algorithms for pattern classification implemented in MATLAB
- Based on the Computer Manual in MATLAB to accompany Pattern Classification
- Types of files
 - Control routines for the GUI (e.g. classifier)
 - Preprocessing and feature selection algorithms
 - Error estimation methods
 - Clustering algorithms (e.g. k-means)
 - Classification algorithms

Starting Point

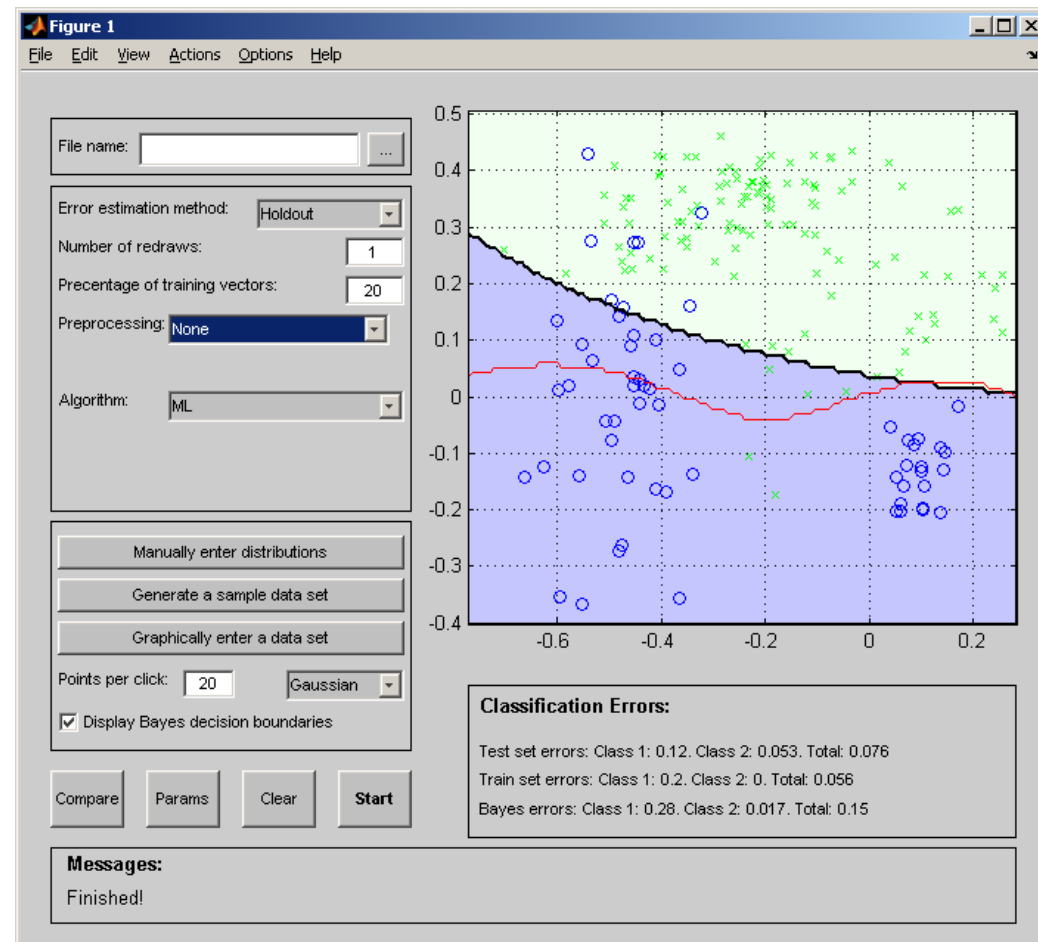

Download base package of the classification toolbox from the exercise homepage <http://www5.cs.fau.de/lectures/ws-1415/pattern-recognition-pr/exercises/> and expand it to a local directory
(Login required!)

- The base package does not contain classification algorithms
- You will implement the algorithms of the lecture during the semester

Usage of the Classification Toolbox

- Set MATLAB working directory to the toolbox
- Call toolbox starting routine:
`>> classifier`
- GUI can be used to
 - Create samples
 - Preprocess
 - Classify
 - Evaluate results

Toolbox Architecture

- Inputs:
 - Patterns used for training: `train_patterns`
 - Labels for training samples: `train_targets`
 - Patterns used for test: `test_patterns`
 - Optional parameters: `parameters`
- Output: `test_targets`
- Example:

```
% Classify using the nearest neighbor algorithm
function test_targets =
NearestNeighbor(train_patterns, train_targets,
test_patterns, parameters)
```

Toolbox Architecture

- Copy M-file of algorithm to toolbox directory
- Add a reference line in `Classification.txt` with the format:
`<Algorithm name>@<Caption>@<Default Parameters>@<Display field>`
 - `<Algorithm name>`: name of algorithm AND M-file
 - `<Caption>`: caption to be displayed near the parameter entry box
 - `<Default parameters>`: set of parameters given as initial set
 - `<Display field>`: indicates whether parameters are needed or not
 - Type `N` in this field if no parameters are needed
 - Type `S` to open a short parameter window in the GUI
 - Type `L` to open a long parameter window whenever algorithm is invoked
- Describe the algorithm in `contents.m`

Toolbox Architecture

- **Examples:** Classification.txt
 - NearestNeighbor@ @ @N
 - KNearestNeighbor@Num of nearest neighbors:@3@S
 - SVM@Kernel, Ker param, Solver, Slack:@['RBF', 0.05, 'Perceptron', inf]@L
- **Examples:** Contents.m
 - % Parametric classification algorithms
 - % ML - Maximum likelihood algorithm
 - %
 - % Non-parametric classification algorithms
 - % NearestNeighbor - Nearest neighbor algorithm

Nearest neighbor algorithm

- Nearest neighbor classifier:
assign a test pattern to the class of the closest training pattern

$$y^* = y_{i^*}$$

$$i^* = \operatorname{argmin}_i \|\mathbf{x}^* - \mathbf{x}_i\|$$

- Implement as MATLAB function
- Integrate M-file to classification toolbox
- Generate training/test patterns in GUI and test the algorithm
